Vesspr Product Metrics

As of: 2026-08-13 | Source: prod RDS (vespr.cfkeo6yq0wzt.eu-north-1.rds.amazonaws.com)

User Base Overview

Metric	Value
Total registered users	239
Onboarding complete	67 (28%)
Paid subscribers	53 (22%)
Paused/opted-out	165 (69%)
Telegram users	107 (45%)
WhatsApp users	132 (55%)
iMessage users	0

Weekly and Monthly Active Users

Active = user sent at least 1 message in the period.

Period	Active Users (any sender)	Active Users (user-sent only)
WAU (last 7 days)	42	17
MAU (last 30 days)	60	49

WAU/MAU ratio: $17/49 = 35\%$ (indicates most active users engage weekly, not just monthly).

New Users Per Week (last 8 weeks)

Week Starting	New Users	Completed Onboarding
2026-08-10	5	2
2026-08-03	42	12
2026-07-27	44	16
2026-07-20	49	10
2026-07-13	31	2
2026-07-06	15	1
2026-06-29	3	0
2026-06-22	18	4

Average onboarding completion rate across weeks: ~15-36%. Sharp spike in late July / early August. Week of Aug 10 is partial.

D1, D7, D30 Retention

Retention = user sent at least 1 message on that day window after signup.

Cohort	Retained	Eligible Users	Retention Rate
D1 (within 48h of signup)	48	239	20.1%
D7 (day 6-8 after signup)	12	221	5.4%
D30 (day 29-31 after signup)	1	72	1.4%

Only 23.4% of all registered users ever sent a message (56/239). Most drop off before even starting a conversation.

Messages per Retained User

Period	Active Users	Avg User Messages	Avg Total Messages (both sides)	Total User Messages
WAU (7 days)	17	31.9	69.1	542
MAU (30 days)	49	46.7	108.0	2,289

Active users who stick are highly engaged: ~32 messages sent per week, ~47 over the last month.

Percentage of Proactive Check-ins Opened (Reply Rate)

“Opened” is approximated as: user replied within 24 hours of the check-in being sent.

Trigger Type	Sent	Replied Within 24h	Reply Rate
TOTAL	1,838	383	20.8%
guaranteed_checkin_morning	1,206	163	13.5%
guaranteed_checkin_evening	189	33	17.5%
guaranteed_checkin_afternoon	146	21	14.4%
emotional_followup	76	41	53.9%
morning_checkin	74	28	37.8%
trajectory_alert	38	24	63.2%
boundary_apology	37	31	83.8%
ambient_presence	20	10	50.0%
crisis_aftercare	20	11	55.0%
evening_wrap	9	5	55.6%
inactivity	8	4	50.0%
pause_hint	6	6	100%
magic_moment	6	5	83.3%
event_based	2	0	0%
pattern_recognition	1	1	100%

Key insight: Scheduled mass check-ins (morning/afternoon/evening) have the lowest reply rates (13-17%). Contextually triggered check-ins (boundary_apology, trajectory_alert, crisis_aftercare) perform 4-6x better.

Percentage Receiving a Meaningful Reply

Approximated from active user message counts vs check-in reply rates above.

- 20.8% of all AI-initiated check-ins receive a reply within 24h.
- Of 49 MAU users: average 46.7 messages sent (user-side) vs 108.0 total (meaning ~57 AI messages per user per month).
- The guaranteed morning check-in (the highest volume, 1,206 sent) only gets a 13.5% reply rate – bulk of volume is low-engagement scheduled pings.

Notification Opt-out and Uninstall Rates

Telegram/WhatsApp block counts are not directly tracked in DB. Proxy metrics:

Metric	Value
Total users	239
isPaused = true	165 (69%)
memoryPaused = true	2 (0.8%)
Onboarded but paused	~estimate: high

69% pause rate is very high. This is likely the primary “soft uninstall” signal – users who received messages but stopped engaging and paused the bot rather than blocking.

How Retention Differs Between Acquired Cohorts

Source	Users	Ever Messaged	Activation Rate	D7 Retained	D7 Rate
organic	218	52	23.9%	12	5.5%
meta (paid)	2	0	0.0%	0	0.0%
ig (paid)	1	0	0.0%	0	0.0%

Paid acquisition (meta/ig) has 0% activation in this sample – too small a sample to conclude (only 3 paid users total), but no paid user has ever sent a message.

Organic / Referral Percentage

Source	Users	% of Total
Organic / Direct (no UTM)	233	97.5%
Instagram (ig)	2	0.8%
Meta (meta)	2	0.8%
Facebook (fb)	1	0.4%

Almost entirely organic acquisition. No referral program is tracked in the DB.

User Acquisition Cost

No paid acquisition spend data is available in the DB. Only 3 users have a UTM source from paid channels (meta/ig/fb). Cost data would need to come from Meta Ads Manager directly.

Estimate: UAC is effectively \$0 for organic users. Paid spend (if any) divided by 3 conversions = very high CAC.

Cost Per Active User and Inference Cost

From UsageCounter (last 30 days):

Period	LLM				
Granularity	Messages	Voice Notes	Image Gens	AI Initiated	Users
daily buckets	2,205	20	1	0	59
weekly buckets	2,127	19	1	0	58
monthly buckets	1,274	10	0	0	53

Using monthly bucket as the canonical 30-day figure: - ~1,274 LLM calls across 53 users = ~**24 LLM calls per active user per month** - Voice notes: 10 total across 53 users (minimal usage) - Image generation: effectively 0

Rough inference cost estimate (assuming ~\$0.002/call average for the model in use): - 1,274 calls x \$0.002 = ~\$2.55/month total inference for active users - Per active user: ~\$0.05/month

Actual cost depends on token length per call. This is a lower-bound estimate.

Safety Incident and Escalation Rates

Level	Description	Incidents	Unique Users	Date Range
Level 3	Immediate crisis – pre-written crisis message, pipeline skipped	1	1	2026-07-19
Level 2	Gentle intervention – crisis prompt override + resources appended	7	5	2026-05-30 to 2026-08-13

Total: **8 safety incidents across 5 users** since launch. - Escalation rate: 5/239 users = **2.1% of all users** have triggered a safety event. - No Level 1 incidents on record (or not logged at L1). - Most recent L2 was today (2026-08-13), indicating active monitoring is working.

Geographic Distribution

Country	Users	%	Onboarded	Paid
US	86	36.0%	22	10
(unknown)	47	19.7%	10	15
IN (India)	30	12.6%	13	17
GB (UK)	24	10.0%	7	0
AE (UAE)	13	5.4%	8	1
AU (Australia)	12	5.0%	5	0
CA (Canada)	9	3.8%	0	6
BR (Brazil)	9	3.8%	1	0
TR (Turkey)	3	1.3%	0	0
MX, JP, CL, ES, CO	6	2.5%	1	3

Notable: India (12.6% of users) has the highest paid conversion rate of any identified country (17/30 = **57% paid**). Canada also punches above its weight (6/9 = 67% paid). US has low paid conversion (10/86 = 12%). GB and AU have 0 paid users.

What Users Do That Surprised Us

Based on message patterns and engagement data:

1. **Highly engaged users are very engaged:** WAU users average 32 user messages per week – this is deeper engagement than most consumer apps see. The users who stay are genuinely talking to Pellow, not just tapping around.
2. **69% pause rate:** The majority of registered users have paused. This is the dominant behavior post-signup, not deletion or blocking. Users are not angry – they are just not ready or not engaged enough. This is a product-fit signal, not a churn signal per se.
3. **Boundary apology works exceptionally well:** 83.8% reply rate on boundary_apology check-ins – one of the highest of any trigger type. When Pellow acknowledges overstepping and apologizes, users respond. This is a strong signal for the emotional intelligence positioning.
4. **India converts to paid at 57%:** Despite being a PPP-pricing market, India has the highest absolute paid user count (17) and the highest conversion rate. This was likely not anti-

pated given India's reputation for price sensitivity.

5. **Canada users all pay, nobody onboards:** 9 CA users, 6 paid, 0 completed onboarding. They are paying without going through the onboarding flow – possibly direct payment link or word-of-mouth bypassing the bot's onboarding sequence.
6. **Contextual triggers massively outperform scheduled ones:** trajectory_alert (63%), crisis_aftercare (55%), emotional_followup (54%) vs. guaranteed_checkin_morning (13.5%). Users ignore scheduled morning pings but respond when the bot demonstrates it actually understands their situation.
7. **Voice notes barely used:** Only 10-20 voice notes across all users in 30 days despite the feature existing. Text is overwhelmingly the preferred medium.
